

Yocto Project

TechLeef Academy (discord.gg/techleef - youtube.com/@techleef-tn)

Prerequisites

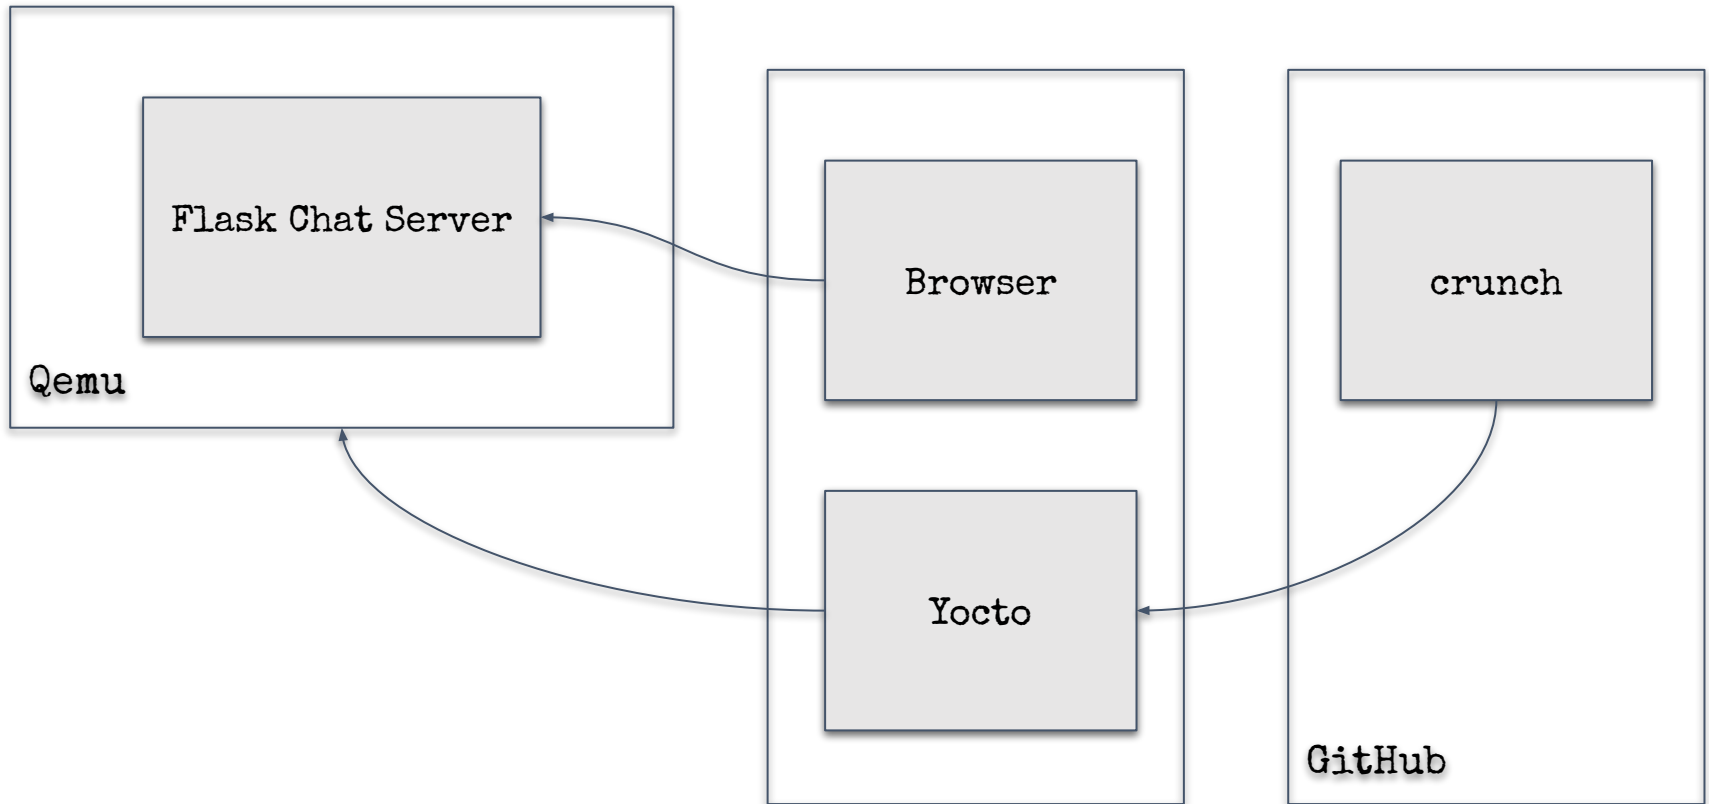

What you need to know to work on the project:

- How to create and manage layers
- Recipe development (*Git sources*)
- Runtime dependencies
- Python packages
- Patches
- Distro
- Init manager
- Custom image

Description

The project consists of developing a layer for a Flask Chat Server application

Steps

1. Create a new layer for the crunch project named **meta-crunch**
2. Create a recipe for crunch named: **crunch_git.bb**
3. Integrate all python runtime dependencies:
 - a. Hint: check **requirements.txt** of the crunch project
4. Create a custom distro to enable **systemd**
5. Create a **systemd** service to run the flask application at boot
6. Apply the **MIT** license of the crunch project
7. Create a custom image based on **core-image-minimal** to integrate the crunch app
8. Test the application
